

Hashflare Profit Calculator

Hashflare Profit Calculator

Hashflare Profit Calculator – How To Use It

Profit is computed by means of the deduction of costs from income.

The income comprises of day by day payouts which estimate relies on the hashrate. With a specific end goal to compute an expected income utilizing the hashrate you should incorporate it in one of the hashflare profit calculator beneath (set all Power value to zero):

1. [Bitcoin](#) – for SHA-256
2. [Litecoin](#) – for Scrypt
3. [Ethereum](#) – for ETHASH
4. [DASH](#) – for X11

Next, deduct the support + power charge of 0.0035 USD per 10 GH/s of SHA-256 and 0.01 USD per 1 MH/s of Scrypt from the income. ETHASH and X11 contracts are not subject to any expenses.

The total you end up with after using the hashflare profit calculator is your assessed profit.

Costs and Payouts

Costs depend on a level rate of \$0.16 per GHs and charges are the most minimal available now with a shocking \$0.0008/GHs/day!

Payouts are made once a day (midnight UTC) on your hashflare account, from which you can withdraw as much as you need, when you need. To withdraw will require a 0.0003 commission (for miners charges), so it's logical to not withdraw each day.

You also can decide to reinvest your profit in hashrate. If you decide to do this, your balance will be utilized to purchase new hashrate upon each new payout. You can benefit from hashflare mining using this promo code **"9AEE5A6E"** (10% off any order).

Payments Methods

Hashflare accepts the following payment methods:

- Bitcoin (BTC)
- Credit Card (USD)
- Webmoney
- Payeer
- Wire transfer (USD)
- From balance

With the hashflare profit calculator you can easily know your profit per day, month, and per year. This can help you keep track of your cloud mining and give you the best time to reinvest so you can earn more profit.
